

## Instructions of Use

### **TetraAqua® Algizit**

Eliminates even stubborn algae problems

- Maximum algae control due to powerful formula
- Fast and safe method

For all freshwater aquaria

### **Maximum Algae Control**

TetraAqua® **Algizit**, with its highly effective agents, reliably combats even stubborn algae problems. Algae have a negative effect on aquaria and inhibit plant growth by consuming valuable nutrients. On a long-term basis, algae negatively influence the biological balance of aquaria.

### **How Algizit works**

- Contains intensive agents for immediate algae control
- Fast and easy removal of algae
- Eliminates the risk of plants dying off due to excessive algae
- The water is not discoloured
- Harmless to fish, plants and micro-organisms (when used in accordance with instructions)

### **Easy to Use**

- 1 tablet per 40 litres of aquarium water
- Put directly into the aquarium water – preferably where there are no plants and where the water is moving. With stubborn cases of algae growth, repeat the treatment after 3 to 4 weeks.
- Aquarium must be ventilated during treatment with algicides to ensure the sufficient supply of oxygen.

### **Recommendation:**

All TetraAqua® algicides are compatible. When algae problems first arise, use **AlguMin** and then **Algetten**, with the depot effect, to prevent new algae from forming. **Algizit** is the ideal "emergency stop" in stubborn cases of algae growth, making your aquarium beautiful again and enabling your plants to grow as well as in natural surroundings.
