

Instructions for Use

TetraAqua® AquaSafe®

Makes tap water safe

- Neutralises chlorine and heavy metals which are harmful to fish
- Protects against wounds, abrasions and infection
- Reduces stress

For all tropical, coldwater and marine aquaria

Untreated tap water is dangerous to fish because of the chlorine and metal ions present. By adding TetraAqua® AquaSafe® to the aquarium whenever adding tap water, these harmful chemicals are instantly neutralised, making the tap water safe for your fish.

Extensive research into the needs of aquarium fish has enabled Tetra to formulate TetraAqua® AquaSafe® with a unique four-way action;

- It quickly neutralises all harmful chlorine and dangerous metal ions
- The unique colloid ingredient coats the gills and sensitive membranes of fish to protect the whole fish against wounds and abrasions.
- It helps to protect against bacterial and fungal infections and aids the healing process
- It contains Vitamin B1 which reduces fish stress in the aquarium

Directions for Use:

Treat all tap water before it is added to the aquarium by adding 5ml of TetraAqua® AquaSafe® for every 10 litres (approx 2 gallons) of water. Stir well to ensure that the AquaSafe is evenly mixed.

For Aquarium Use Only

Keep out of reach of children
